Abstract. A contribution to knowledge of and first census of the moths of Vidrà (Osona). The results of a three-year study of the moths of Vidrà (Osona) using ultra-violet light traps and a generator to power mercury-vapour lamps are given. In all, 632 species of moth belonging to 30 families were detected.

Resum. Es presenten els resultats de l'estudi que s'ha fet durant tres anys a Vidrà (Osona), a la recerca d'heteròcers amb el mètode de prospecció amb trampes de llum ultraviolada i un grup electrogen que alimenta làmpares de vapor de mercuri. En total s'han censat 632 espècies de 30 famílies de lepidòpters.

Key words: Heterocera, Lepidoptera, faunistics, Vidrà, Catalonia, Iberian Peninsula.

Introducció

L'any 2013 es va començar un estudi de lepidòpters heteròcers a l'EIN (Espai d'Interès Natural) de les Serres de Milany-Santa Magdalena i Puigsacalm-Bellmunt, incorporat al PEIN (Pla d'Espais d'Interès Natural) l'any 1992. Concretament, es va prospectar el camí de la Vila Vella, una pista forestal que va a parar a l'església romànica de Sant Bartomeu de Covildases seguint el rierol de la Vila Vella (afluent del riu Ges). Es tracta d'una zona essencialment humida dels voltants de Vidrà (Osona). Es va triar aquest indret pel seu interès en l'estudi biogeogràfic de les espècies. Està situat al Prepirineu i presenta una vegetació caducifòlia força diversificada en què dominen l'avellaner (*Corylus avellana*), el vern (*Alnus glutinosa*), el salze (*Salix fragilis*), el faig (*Fagus sylvatica*), el bedoll (*Betula pendula*), el pollancre (*Populus nigra*), el tiler (*Tilia platyphyllos*), etc. Les coordenades UTM 10×10 de la zona prospectada, que està situada a 960 m d'altitud, són 31TDG46.

Els objectius d'aquest treball són dos: d'una banda, donar a conèixer la biodiversitat de la fauna lepidopterològica d'aquesta zona tan especial des del punt de vista biogeogràfic (representa un dels límits meridionals de moltes espècies eurasiàtiques), i, de l'altra, fer un cens de les espècies d'heteròcers que l'habiten.

Les prospeccions van començar el 30 d'agost de 2013 i es van acabar a últims d'octubre del 2016. En aquest espai de temps s'han fet 60 prospeccions, distribuïdes regu-

l'any. Les condicions meteorològiques d'aquest període han estat variables i bastant desfavorables en els dos últims anys, sobretot per l'extrema sequera del 2016. Això pot haver alterat el cicle biològic dels lepidòpters i haver fet impossible detectar algunes espècies que segurament hi són presents.

Els resultats encara són preliminars quant al nombre de tàxons comptabilitzats (tres anys i escaig de prospeccions no són suficients per fer un cens complet d'una zona tan variada), però l'estudi continua, i segur que la llista d'espècies augmentarà en properes visites a la zona estudiada. Així es podrà obtenir una informació força més completa de la biodiversitat dels heteròcers de l'entorn de Vidrà.

Material i mètodes

S'han utilitzat els mètodes habituals per al mostreig nocturn: quatre trapes Heath de llum actínica de 6 W situades als mateixos punts durant l'estudi, i el parament de llençols amb dues làmpares alimentades per un grup electrogen; una, de vapor de mercuri de 125 W, i l'altra, de mescla de 250 W, una a cada banda del llençol, també col·locat al mateix lloc en tot el període d'estudi. Aquest muntatge pretenia comparar la incidència d'atracció dels heteròcers amb diferents tipus d'intensitat lumínica, si bé no s'ha pogut arribar a cap conclusió respecte a aquest punt. S'han fet visites sistemàtiques entre una i quatre vegades al mes, segons si els mesos es consideren de menor o major activitat lepidopterològica.

A l'hora de confeccionar l'ordre i la llista sistemàtica dels Noctuids s'ha seguit el catàleg de Redondo & Gastón (2010) amb algunes actualitzacions taxonòmiques posteriors (Yela 2002). Quant als geomètrids, s'han fet servir el catàleg de Karsholt & Razowski (1996) i les llistes sistemàtiques de Hausmann (2001, 2004), Hausmann & Viidalepp (2012), Mironov (2003) i Skou & Sihvonen (2014). Per a la determinació dels microlepidòpters s'han utilitzat les obres de Slamka (2006, 2008, 2013), Parenti (2000) i Goater *et al.* (2005).

Resultats

Com a resultat d'aquest treball es presenta una llista (annex 1) de les espècies censades, amb les dates de recerca i el nombre d'exemplars observats. S'han comptabilitzat 632 espècies, distribuïdes en 30 famílies, segons s'indica a continuació:

Adelidae	3	Lypusidae	1	Pyralidae	15	Drepanidae	12
Blastobasidae	1	Gelechiidae	5	Crambidae	41	Geometridae	195
Peleopodidae	1	Plutellidae	2	Hepialidae	1	Notodontidae	27
Ethmiidae	1	Depressariidae	4	Cossidae	3	Lymantriidae	6
Psychidae	1	Coleophoridae	1	Limacodidae	2	Arctiidae	24
Oecophoridae	3	Scythrididae	1	Lasiocampidae	10	Noctuidae	215
Choreutidae	1	Tortricidae	43	Saturniidae	2		
Ypsolophidae	3	Pterophoridae	3	Sphingidae	5		

En total s'han fet 17.013 observacions. En la figura 1 s'indiquen les espècies més abundants en quantitat d'exemplars. En la figura 2 s'indica les vegades que individus d'una espècie han estat observats atrets per la llum. Entre aquests cal ressaltar *Colocasia coryli* (Linnaeus, 1758), *Stauropus fagi* (Linnaeus, 1758), *Peribatodes rhomboidaria* ([Denis & Schiffermüller], 1775) i *Thyatira batis* (Linnaeus, 1758), que han estat atrets per la llum gairebé en totes les èpoques de l'any. Per contra, de 188 espècies (aproximadament un 39 %), tan sols se n'ha fet una observació, i de 143, només se n'ha observat un sol exemplar.

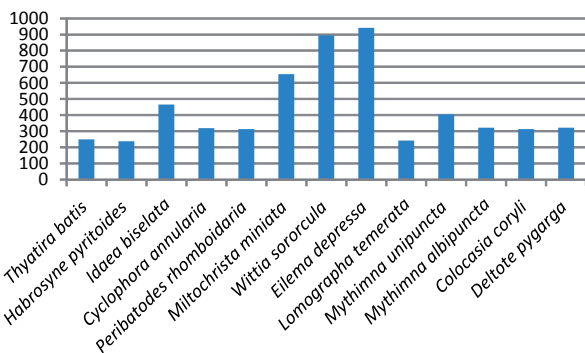

Fig. 1 Espècies detectades més abundants.

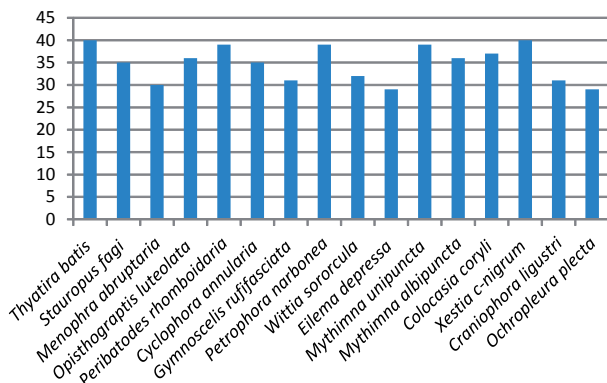

Fig. 2 Espècies detectades més freqüents.

Entre el conjunt d'espècies observades destaquem els següents tàxons d'interès:

Els depressàrids *Semioscopis avellanella* (Hübner, 1793), que ha estat citat com a nou per a la península Ibèrica recentment (Dantart 2014), i *Semioscopis steinkellneriana* ([Denis & Schiffermüller], 1775), amb tan sols una citació ibèrica anterior, de fa més de deu anys (Dantart 2004).

Els pterofòrids *Stenoptilia bipunctidactyla* (Scopoli, 1763) i *Merrifieldia leucodactyla* ([Denis & Schiffermüller], 1775), escassament citats a Catalunya.

El cràmbid *Phlyctaenia stachydalis* (Zincken, 1821), que se cita per tercer cop al nostre país.

S'han observat els geomètrids *Cepphis advenaria* (Hübner, 1823), amb molt poques citacions de Catalunya; *Epione vespertaria* (Linnaeus, 1758), que es coneixia només de la Vall d'Aran; *Pasiphila chloerata* (Mabille, 1870), amb tan sols una altra referència de Catalunya, i *Acasis viretata* (Hübner, 1799), que també ha estat escassament trobat.

Els noctuids *Amphipyra livida*, ([Denis & Schiffermüller], 1775), escassament citat a Catalunya, i *Apamea illyria* (Freyer, 1846) i *Pechipogo strigilata* (Linnaeus, 1758), les úniques referències dels quals eren de la Vall d'Aran.

Finalment, el limacòdid *Heterogenea asella* ([Denis & Schiffermüller], 1775)], que vindria a confirmar la seva presència a Catalunya després d'haver-lo citat d'Osor Ahola & Kohonen (1985) fa més de trenta anys.
